positioning a brush holder having a plurality of brushes and at least one tab with respect to the magnets; and

sliding each tab into the space between the magnets to align the plurality of brushes with the magnets such that the tab directly engages the opposing ends of the magnets.

9. (New) A motor assembly structure produced according to the method of claim 8 comprising:

a motor housing;

at least one pair of magnets having opposing ends disposed within the motor housing in a spaced relationship to form at least one space therebetween; and

a brush holder having at least one tab directly engaging the opposing ends of the magnets within the at least one space.

10. (New) The motor assembly structure of claim 9, wherein the pair of magnets having two opposing ends forming two spaces and the brush holder has two tabs to fit in the two spaces.

11. (New) The motor assembly structure of claim 9, wherein the two spaces are disposed opposite each other and the two tabs on the brush holder are also disposed opposite each other.

12. (New) The motor assembly structure of claim 9, wherein the pair of magnets is attached to an inner surface of the motor housing.

13. (New) The motor assembly structure of produced claim 8, comprising:

a motor housing;

a pair of magnets attached to an inner surface of the motor housing in a spaced relationship to form two spaces lying generally opposite each other;

cont.

an armature disposed in between the pair of magnets; and
a brush holder having a plurality of brushes and two tabs positionable within the two spaces formed by the pair of magnets to align the plurality of brushes with the magnets.

14. (New) The motor assembly structure of claim 13 further comprising:

the tabs fit within the two spaces in a sliding engagement.

15. (New) The motor assembly structure of claim 13 further comprising:

the pair of magnets and the tabs surround the circumference of the armature after the motor housing and the brush holder are assembled together.

16. (New) A motor assembly housing comprising:

a motor housing;

at least one pair of magnets having opposing ends disposed within the motor housing to define a space therebetween; and

a brush holder having at least one tab with substantially uniform width directly engaging the opposing ends of the magnets within the initial space.

17. (New) The motor assembly of claim 16, wherein the pair of magnets forms two spaces and the brush holder has two tabs to fit in the two spaces.

18. (New) The motor assembly of claim 17, wherein the two spaces are disposed opposite each other and the two tabs on the brush holder are also disposed opposite each other.

19. (New) The motor assembly of claim 17, wherein the pair of magnets is attached to an inner surface of the motor housing.

20. A method for locating a motor brush to a magnet comprising the steps of:

attaching at least one pair of magnets having opposing ends within a motor housing to define a space therebetween;

positioning a brush holder having a plurality of brushes, the brush holder having at least one tab in an initial position relative to the space defined between the pair of magnets; and

directly engaging the at least one tab with the opposing ends of the pair of magnets within the space to reposition the brush holder to a final position in alignment with the magnets.
